

INSTALLATION INSTRUCTION FOR THE STER-O-TAP BACTERIA FILTER

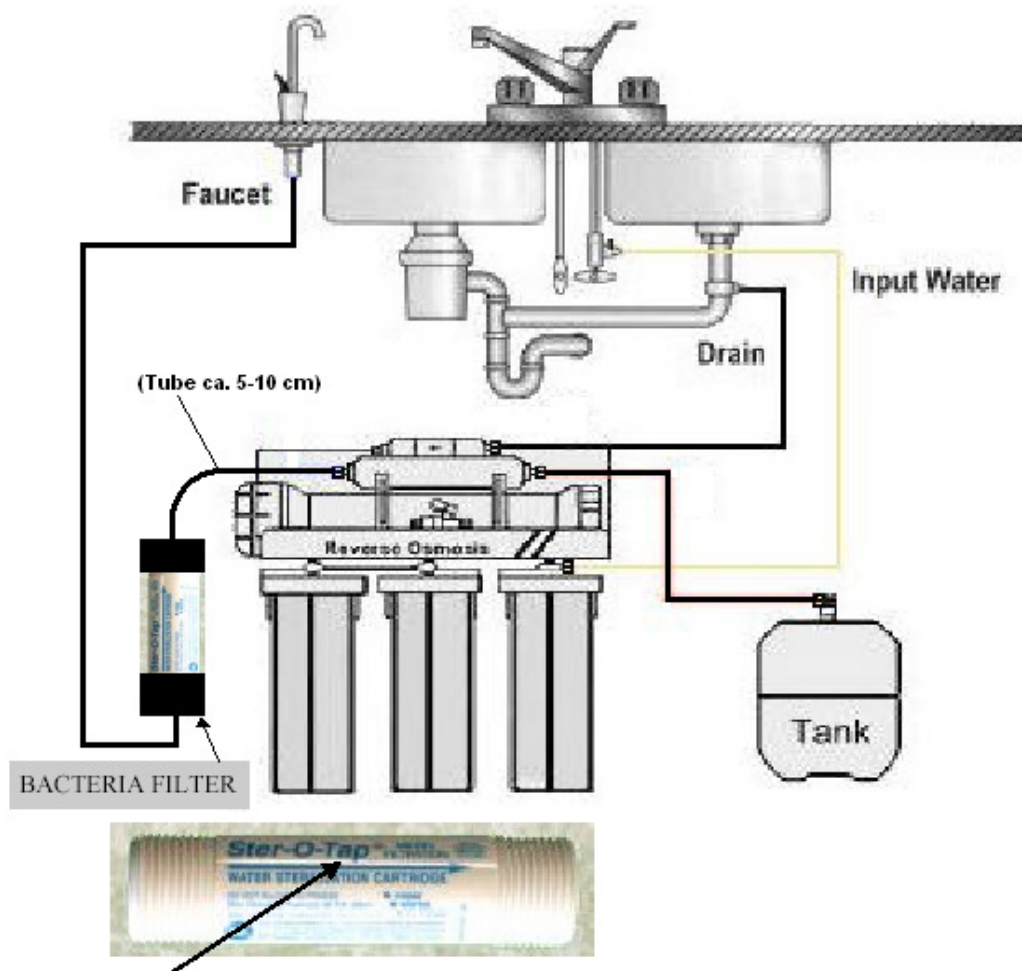

The Bacteria Filter is to be installed between the Post Filter and the Faucet. This has to be done after the Reverse Osmosis System is fully working.

Caution: Only install the Bacteria filter after flushing the system, i.e. when replacing filters or initial start up.

To install, turn off the tank, and turn off the water supply to System. Then release the pressure by opening the faucet.

Cut the tubing to the faucet and insert the tubes, by pushing them firmly into the bacteria filter fittings.

After the installation, turn on the tank and the system, and let the water run through the filter for a few minutes. After that the Filter is ready to use.

Please note the arrow on the bacteria filter. This indicates the flow direction of the filter. Please insure that the filter is installed in the right direction.
